using cryoSPARC

modify the particles.star from Warp

The particles.star files generated by Warp during the on-the-fly processing link each particle to its tif movie. To import the particles in cryoSPARC and keep the link with the motion corrected micrographs, the star file must be edited.

To edit the particles.star file in **vi** type:

```
vi allparticles_BoxNet2Mask_*.star
```

or

```
vi goodparticles_BoxNet2Mask_*.star
```

Change the location of movies to the motion corrected ones:

```
:
%s/ <firsts_characters_of_movie_files>
\/average/<firsts_characters_of_movie_files>
```

Change the file type of the motion corrected micrographs:

```
:
%s/tif/mrc
```

Save the changes and close **vi**:

```
:
wq!
```

You can now import the particles in **cryoSPARC** using the **Import Particle Stack** job and parameters:

- Micrograph data path: *average/<firsts_characters_of_movie_files>*.mrc*
- Particle meta path: *goodparticles_BoxNet2Mask_*.star*
- Particle data path: *particles/*
- Check : *Remove leading UID in input micrograph file name*

Generate a defect file for cryoSPARC

Gain/defect files coming from Glacios must be flipped along Y axis when imported in cryoSPARC.

Gain file is by default named CountRef…mrc (with a pixel size of 1)

Defect file is by default a text file

When importing the movies you should give a defect map file as well as the gain reference file.

Load IMOD

```
module load imod (on cbi-... servers)
setimod (on xtallo machines)
```

You can make a defect map from the text file with 'clip defect' in IMOD 4.10.7 or higher:

```
clip defect -D defects...txt  fileWithFrames  defects...mrc
```

where the fileWithFrames is used only to set the size of the output and can be any file of the right X and Y size.

If the defect text file is not recognized by cryoSPARC, the Gain file has to be modified to put a value of 0 on defective pixels (because any pixels that have a value of 0 in the gain reference file are treated as defects).

In the Gain file, the defective pixels have a value of 1, so you need to subtract the defects...mrc file from the Gain...mrc file

```
subimage Gain...mrc defects...mrc Gain_subimage...mrc
```

The pixel size will messed-up and has to be fixed to get back to a value of 1

```
alterheader -fixpixel Gain_subimage...mrc
```

Now the Gain_substracted...mrc file has a zero value for defective pixels instead of 1.

Remark: the defect file generated by the Glacios now (2021-10-27) is a map mode 2 and has a pixel spacing of 0.9372, but the images have a pixel spacing of 0.901. It might be better to change the last command by

```
alterheader -del 0.901,0.901,0.901 Gain_subimage...mrc
```

```
