

Structure polishing

For the validation of datasets and models, use the “*paired refinement*” procedure (evolution and comparison of CC*, CCWORK and CCFREE¹⁾).

For a structure in an advanced state, always compare our results (datasets/models) with the automated protocols PDB_REDO and Phenix Optimize final model [alpha]. For confidentiality issues PDB_REDO will be installed locally.

Need to think about setting up an internal database to access to final models, structure factors file, and all related information and results.
