The TF20 microscope interfaces

The microscope console

Location: right in front of you on the desk

Role: It provides direct control of some of the most important microscope parts:

- Magnification
- Electron dose: spot size (C1 lens) and beam spread (C2 lens)
- Focus (objective lens current)
- Stage position (with the joystick and Z buttons)
- Beam position (with the trackball)
- and many other actions through the programmable switches (L/R1-2-3) and Multifunction X/Y knobs.

Gatan DigitalMicrograph User Interface (DM)

Location: On the left screen

Role: It controls the US10001 Camera.

- the user will use it to :
    - prepare Dark and gain references.
    - during screening, to acquire images in continuous mode.

SerialEM User Interface (SEM)

Location: On the right screen

Role: It provides camera/microscope commands to allow the user to screen its grids and setup an automated data collection.

- The beginner user will use it to:
    - record the Atlases.
    - select squares and prepare the square maps at eucentric height.
    - select targets (position).
    - screen targets at higher magnification (as single image or montage).
    - center the different beam modes all together on the camera axis.

- The expert user will use it to:
    - perform all the actions described above.

- perform beam corrections (astigmatism, coma-free).
- perform calibrations.

The TEM User Interface (TUI)

Location: On left screen

Role: It controls all the microscope systems.

* It is divided into 4 zones:

- Zone1: TUI tabbed pages hosting different commands allowing to control the ME and to know its working state

*Zone1:TUI tabbed . *Zone 2 : Window giving values of working state : HT value, stage position, magnification, etc … *Zone 3 : Additional TUI Tabbed page *Zone4 : Window defining functions of control panel button:

- The beginner user will use it to:
    - load/unload the grids in the column.
    - change and center the Condenser 2 and objective apertures.
    - control the turbo pump.
    - perform beam-shift adjustments.
    - manually set eucentric height.

- The expert user will use it to:
    - perform all the actions described above.
    - align the microscope.
    - troubleshoot the system.
    - perform cryo-cycle of the column/autoloader.

The FluCam User Interface (FC)

Location: On the right screen

Role: It allows the visualization of the electron beam and the sample image.

```
The beginner user will use it to:
The expert user will use it to:
```
